

Cornerstone MFT Server Events Management

High-end server software exists to improve efficiency in an enterprise environment. Cornerstone's Events Management allows you to set up a variety of automated actions on your server. A simple configuration process sets up your server to do the work for you, from forwarding uploaded files to backup servers to blocking hacking attempts—events management is a powerful and diverse feature.

Cornerstone MFT events management can be configured to launch processes, send notifications or submit files to workflow systems. This is crucial for insight into server activity, and as a result, security.

Cornerstone MFT Events

Flagging a Server Start

Events Management can be used to signal Cornerstone to flag a server start. When a server is started by someone, an email can be sent to the administrator to alert them to this action.

Logging Events

Cornerstone allows you to create a log of every event on the server. The ability to record all events on the server keeps the server secure and keeps administrators informed so they can focus on more important things.

Creating Server Logs

This simple Event Handler allows you to create a custom log for each user account that will access the server. Every event caused by this user will become a custom log message written to that user's log file.

Creating Single-Use Accounts

Assign users a single-use account that will expire immediately after use. Previously, limited-time accounts were created by setting an account to expire after a set number of days. You can still create time-limited accounts, but for a more efficient and truly single-time use account, events management is your key.

Using Events to Thwart Hackers

Unauthorized users or hackers attempting to guess usernames and passwords in order to gain access are some of the most common dangers to servers. Cornerstone MFT Event Management can help thwart them by detecting invalid user attempts. Cornerstone MFT will kick that connection from the server and ban future access from the client IP address, while also sending an alert email to the admin.

How does it work?

South River Technologies is an innovator in secure file management software. More than 90,000 customers in 140 countries use SRT's software to make remote file access and collaboration more efficient for their customers, partners, and workforce.
