

## Cornerstone Managed File Transfer File Sharing

High profile data breaches continue to plague consumer file sharing services, but the risks go far beyond hackers and privacy concerns. When users rely on unsanctioned file sharing services to get their work done, your critical files walk out the door with them if they leave the company. And there's nothing you can do about that. Unless you implement a better solution.

Cornerstone MFT provides the effortless file sharing business users demand, with the security, tracking and control that you need to protect your confidential files and your business.

### Enterprise File Sync and Share (EFSS)

#### Keep your users productive

You and your employees need to get your work done, and you can't settle for inefficient methods. Employees will look to consumer-grade software to fill their needs if there is no workable corporate solution provided. Enterprises and their IT departments struggle to balance the demand for convenience with the need for security. Cornerstone offers the highest levels of security with effortless file sharing to keep your work on the move.

#### Files stay in your control

If your employees transfer files to their own cloud storage, that data leaves your control forever. If the employee leaves your company, they still have that data under their control, and you may not even know. You also lose the ability to track or audit file access—a liability if you are called on to provide records.

#### Access files from any device

The Cornerstone WebUI allows you to access your data from any device with an Internet connection. For instance, at the airport you could login to the Cornerstone WebUI with your mobile device and securely share a contract with an associate, so they're prepared for the meeting when you land. With the WebUI, you have the security of your corporate network without the constraints of the corporate office.

#### Avoid Syncing Complications

Consumer sync-and-share applications comes with hidden security and resource costs. Every synced device holds all of your synced corporate data, which soaks up space; syncing lots of changed files can slow your devices and prevent you from performing time-sensitive tasks. More importantly, if that device is lost or stolen, that data would be vulnerable to anyone who got ahold of the device.

## Service reliability and high availability

Consumer grade products, particularly freeware, don't often make guarantees about their service's reliability. Interruptions in service may be common, and be fixed on a slower timetable than an enterprise grade product. These interruptions are manageable on an individual level, but if they affect an entire organization, productivity could plummet. Cornerstone can perform in a clustered environment with a load-balancer, which gives you the ability to handle unlimited amounts of traffic by transferring usage between servers on the fly. No lag, no server downtime.

## HIPAA compliant

If you work with sensitive medical documents, you are required to comply with HIPAA regulations, including the secure transfer of files. Cornerstone is fully HIPAA compliant, and offers tracking and visibility at all levels, with granular control of user and group permissions.

## Cloud or on-premise options

Cornerstone MFT can perform as either locally-installed server software for your enterprise hardware, or a SaaS in the cloud. Keeping your data in the cloud lowers hardware and support costs, but if you prefer to keep your data in-house for the added security benefits, Cornerstone can accommodate you.

## Encrypt stored files

Transferring a file securely is only one part of a secure solution. If your data is sitting on a server in plain-text, it is vulnerable. Keep your at-rest files encrypted to prevent incidental access to sensitive documents, and add an extra layer of defense to keep cyber attackers who have gained access to your servers from using the data they find.

South River Technologies is an innovator in secure file management software. More than 90,000 customers in 140 countries use SRT's software to make remote file access and collaboration more efficient for their customers, partners, and workforce.
